

Pathologic Determinants of Recurrence and Survival in Stage II Renal Cell Cancer

Daniel Han, Zachary Hamilton, San Diego, CA, Alp Tuna Beksac, Bulent Akdogan, Haluk Ozen, Ankara, Turkey, Sean Berquist, Abd-elrahman Hassan, Charles Field, Aaron Bloch, San Diego, CA, Sumi Dey, Adam Bezinque, Samer Kirmiz, Brian Lane, Grand Rapids, MI, Fang Wan, James Proudfoot, Ithaar Derweesh, San Diego, CA

Introduction

- Stage II RCC has heterogeneous oncologic outcomes
 - Risk of progression, recurrence, and survival may vary widely
- Objective: Analyze pathologic risk factors associated with oncologic outcomes from Stage II RCC in a multicenter, international cohort

Methods

- Retrospective international multicenter analysis of patients who underwent surgical excision of localized stage II renal masses (T2N0M0/AJCC Stage II) from 1987-2015.
- Primary endpoint: recurrence-free survival (RFS)
- Secondary endpoint: overall survival (OS)
- Multivariable analysis (MVA) and Kaplan-Meier Analysis (KMA) were performed

Results

- 1,328 patients analyzed
 - Mean age: 59.2 years
 - Median follow-up: 62.7 months
 - 66.4% male, 33.6% female
 - 20% partial nephrectomy, 80% radical nephrectomy
 - Total number of recurrences: 22.3% (296)

- ¹ • No significant difference in age, gender, comorbidities

Preoperative Tumor Characteristics

Variable	Recurrence	No Recurrence	p-value
Clinic Tumor Size	9.9 ± 2.6	10.0 ± 2.7	0.388
Surgical Approach			<0.001
RN	259 (87.5%)	804 (77.9%)	
PN	37 (12.5%)	228 (22.1%)	

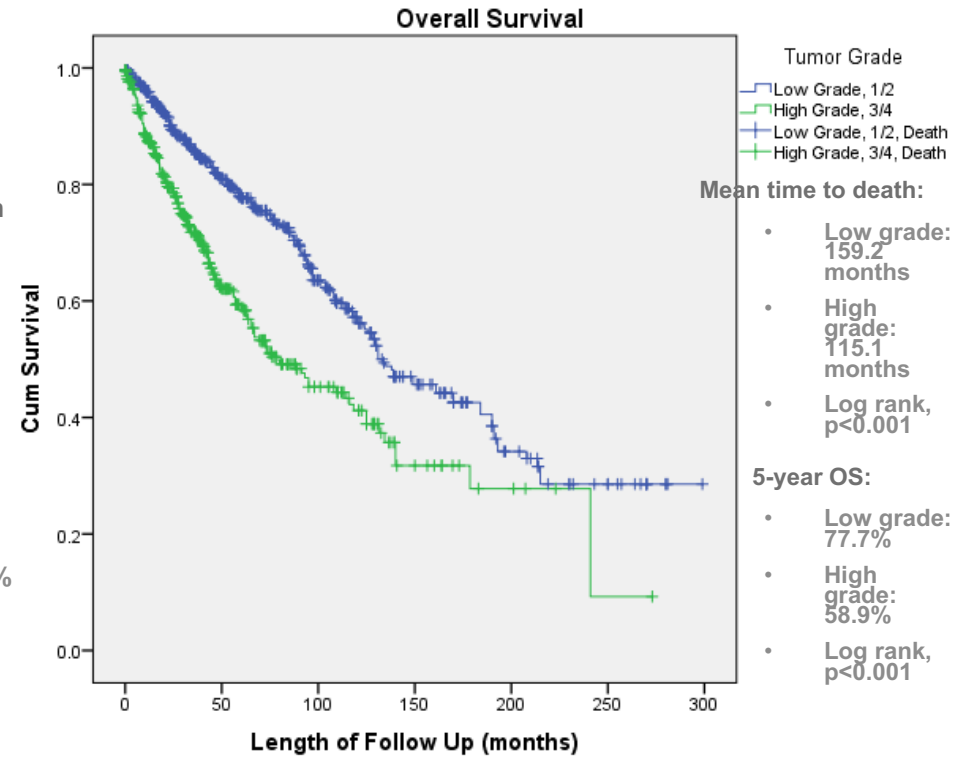

Pathologic Details

Variable	Recurrence (n=296)	No Recurrence (n=1032)	p-value
pTumor Size	10.2 ± 3.2	9.4 ± 2.8	<0.001
Fuhrman Grade			<0.001
Low (1&2)	42.9%	61.6%	
High (3&4)	→ 57.1%	→ 38.4%	
Necrosis	41.8%	38.4%	0.377
LVI	27.7%	14.4%	<0.001
Positive Margin	7.1%	1.6%	<0.001
All-Cause Mortality	72.9%	21.8%	<0.001
Length of Follow Up (months)	52.0 ± 46.8	66.1 ± 58.2	<0.001

Logistic Regression for Recurrence				
Variable	OR	95%CI Low	95%CI High	sig
Tumor Size	.999	.894	1.117	.990
Radical Neph	4.682	1.455	15.066	.010
LND	.999	.541	1.845	.998
# Nodes Removed	.983	.935	1.033	.502
High Grade	2.353	1.451	3.815	.001
Necrosis	.917	.556	1.514	.736
LVI	2.034	1.131	3.657	.018
Positive Margin	2.67	2.165	3.215	.012

Logistic Regression for All-Cause Mortality				
Variable	OR	95%CI Low	95%CI High	sig
Tumor Size	.966	.885	1.053	.429
Radical Neph	4.158	1.828	9.457	.001
LND	1.417	.893	2.247	.139
# Nodes Removed	.991	.957	1.027	.623
High Grade	1.224	.852	1.758	.274
Necrosis	1.225	.857	1.752	.266
LVI	.663	.399	1.104	.114
Positive Margin	3.952	.350	44.669	.267

Results

Conclusions

- For stage II RCC, LVI and Tumor Grade 3/4 are independently associated with increased recurrence and worse overall survival
- Further investigation is requisite and may add weight to consider these specific stage II RCC patients as a higher risk subgroup with implications for staging revision and clinical trial design.
